

Make it work. Prove it. Keep it.

A desk-side guide for the project you already have.

01 **Inspect before changing**

Read trusted project guidance. Confirm source, account, environment and authority. Reproduce the affected journey. Preserve unrelated work.

02 **Make one useful change**

Use existing modules and commands. Check real input plus a negative case. Keep content, permissions and saved drafts intact.

03 **A failed check stops release**

Inspect, validate, review, publish, verify. Bind the reviewed source to the actual target. Inspect the real journey after publication.

04 **An incident starts with evidence**

Separate observations from hypotheses. Investigation grants no response authority. Apply only an authorised bounded response; check recovery independently.

05 **A hook receives data, not orders**

Authenticate using the actual provider protocol. Validate schema and scope. Persist identity, deduplicate and bound retries. Reconcile uncertain effects before repetition.

06 **Leave a useful continuation**

Record source, target, commands, result, interventions and next action. A copy or download is not a successful operation. Code rollback is not data recovery.
